The Problem

Interview preparation today is generic and non-personalized.

Platforms provide static question banks without understanding the candidate's strengths and weaknesses.

Candidates don't get realistic interview simulation or targeted feedback.

Our Goal

Build an AI-driven interview preparation system that:

1. Understands a candidate's skills and weaknesses
2. Builds a dynamic knowledge graph
3. Provides adaptive preparation
4. Simulates a multi-agent interview panel

Our Solution

Knowledge Graph Skill Mapping

Converts candidate profile into a visual skill graph, highlighting strong and weak areas.

Adaptive Preparation Engine

Asks questions based on weak nodes in the graph and updates skill confidence dynamically.

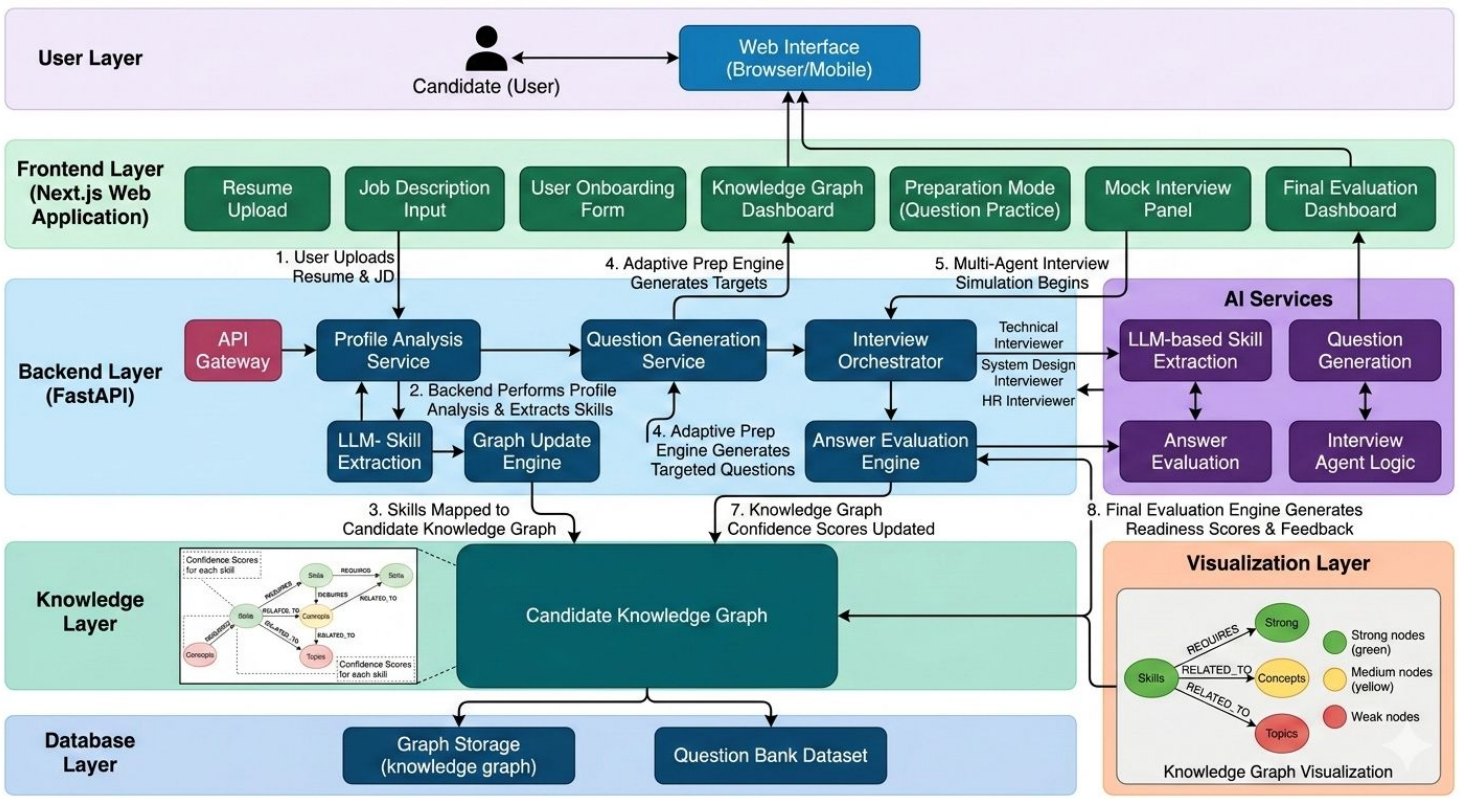
Multi-Agent Mock Interview

Simulates a real interview panel with technical, system design, and HR interviewers.

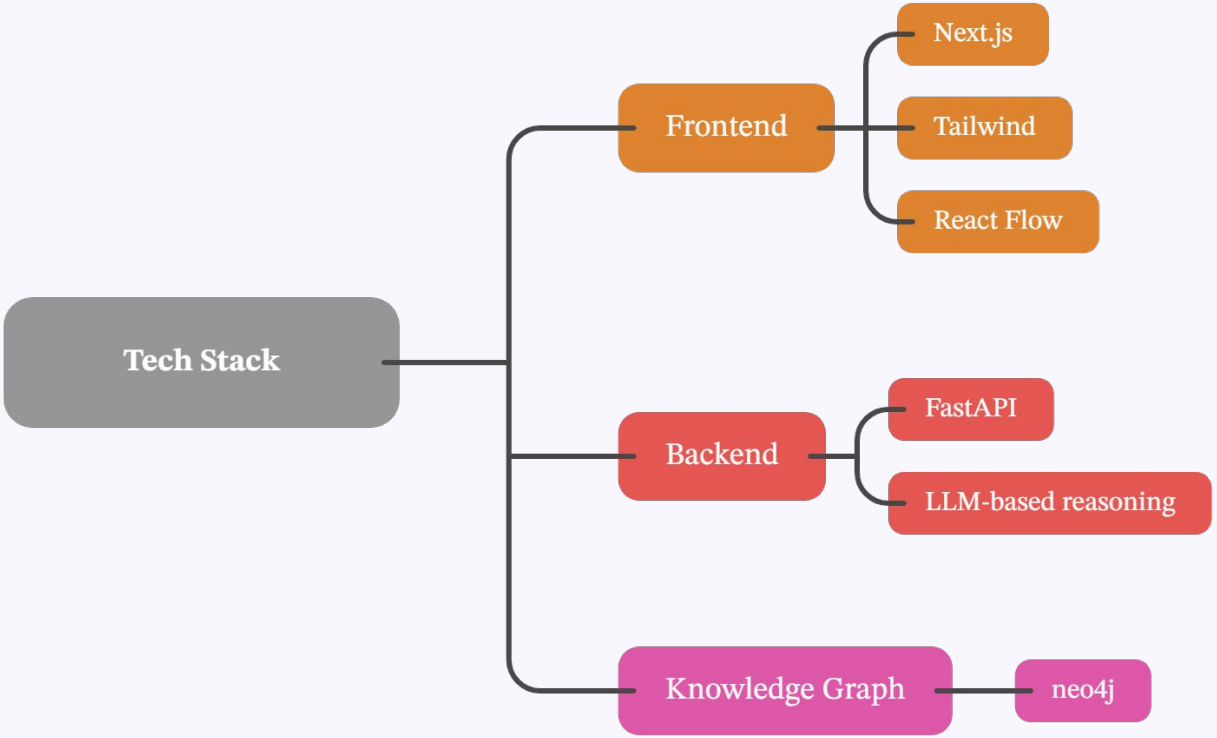
Intelligent Evaluation

Analyzes technical correctness, reasoning depth, and communication clarity to produce a final readiness score.

System Architecture



Tech Stack



Tech Stack
Frontend
Next.js
Tailwind
React Flow
Backend
FastAPI
LLM-based reasoning
Knowledge Graph
neo4j

Thank You!
